

Dr. Philip Nichols of Middleton Pest Control in Orlando, FL tests the AED-2000 with the contact SP-1 probe for finding drywood termites in a wooden post outside his office. He was able to quickly locate the infestation areas by listening for 10-15 seconds at each probe location. Drywood termite colonies may consist of only a few hundred members completely contained within one board. To hear what this infestation sounded like through the headphone audio output, click on the icon below. The snaps and pops in the recording are the sounds of termite feeding.
